Brian,

Thanks a lot for your answer. I have migrated form Eudora that was much more easier to synch.

You must be copying more than the PST, then, because account information is

kept in the registry. You shouldn't have to reset your accounts each time. Setting them up in your mail profile once should be all that's needed. Then, after that, as long as you migrate your data correctly, your account data will never change. Describe the exact process you're using to transfer the PST between systems. Perhaps you're doing something incorrectly. Also review this: <http://www.slipstick.com/outlook/sync.htm>

I have my PST file in DiSK E and Outlook in the default directory in C. This setting is the same in both computers so I can backup and move without any problem other data files,. So what I do is to synchronize DISK E. What this does is to rewrite mail.pst from Disk E >> Disk E in both computers. I use Windows XP, not Vista.

Should I change this scenario ?

Thanks

.
