## Configuration Scenario

- 1) A new laptop with Vista Business installed.
- 2) Under User Account / Manage User Password, I've assigned a \*.domainname so that when I map a network drive within the same domain, it will use the stored username and password to access resource. This works in XP without any issue.

## Problem

- 1) When I manually assign a map drive, the credential prompt for username and password comes up. Why does this come up even though I have done (2) as above.
- 2) Also, when opening Outlook 2000, a credential prompt comes up and after typing the username, domain and password, it lets me through and I can see the email. However, in XP, this credential prompt never comes up.

Is there a fix for this?
