Hi All

I have just discovered to my fury that MS have removed the ability to sync over wifi. This leaves me absolutely stuffed – my wife has a wm 2003 pc synced with our only conveniently accessible computer. I had been planning to run activesync for my new wm 2005 device on an inconveniently located computer and sync via wifi. But I now know I can't.

My question is – if I get a bluetooth access point can I use bluetooth to activesync with the inconvenient computer over my ethernet network??? I am pretty confident that the answer is "no" but thought I'd ask.

Kind regards

Chris

p.s. if anyone has any influence with the relevant MS people, please use it to get them to reverse this stupid policy.

.
