Today I went to sync and here we go again. Dell Axim X30 with AS 3.8. All was fine and now not. Put device in cradle or plug in sync cable –same result: the connect sound is heard and then a few seconds later heard again and again ...go in device manager Dell Axim Sync USB is seen in device manager, then refresh and it is gone, then refresh appears and so on...you get the idea.

Tried reinstalling driver won't work. Don't know if there is a drive on the Dell OEM CD...cannot seem to find one. It won't install anyhow because the device manager keeps losing the usb so installing the driver just hangs because the driver or the device disappears.

Manually uninstalled and reinstalled Per Chris De Herrera website. Tried unchecking root hub sleep options in root hubs. No joy. Completely baffled. Wondering if the sync port I just got replaced a few months ago is bad again.

IF I go into connection settings in AS usb shows as connected, but then disconnects and shows available as the sound of connect and disconnect is heard over and over.

Any other tips are appreciated. Dell Diagnostic tool shows connected for usb when I plug it into cradle.
