Does anyone know much about connecting PocketPC to internet via BlueTooth.

I'm using IPAQ5450 with BlueTooth. Desktop side is WindowsXP with DialUp connection to internet.

I'm struggling to make my Ipaq connected to internet as there are so many things sound ambiguous in settings.

Could anyone give me sort of "Step by step" or "Click. Type. Click. Type..." instruction on how to make anything typen in Ipaq's IE give results like web-page, but not "connection could not be established" or "page not found" ?
