I've spoken with our ActiveSync devs about this, here's what they say:

The actual exchange server name should be entered in the activesync client, not localhost

Hello!

I have a SSL vpn tunnel that works well prior to Windows Mobile 5. Since WM5 have problem with 127.0.0.1. (<http://blogs.msdn.com/cenet/archive/2005/06/06/425799.aspx>) The workaround is to use 'localhost' in web browser and mail client. it works fine.

The problem occurs in the client ActiveSync application. It doesn't work when entering 'localhost' as server address.

Any workaround for this? All input on this is appreciated.

Regards,
