Hello all,

Is there a way to keep wifi alive while the display is turned off? I tried using ExtEscape, SetSystemPowerState as well as SetDevicePower (to bring back power to wifi after switching off the display). all of them seem to switch off display and wifi together.

1. Is there anyway that instant messengers can be run on pocket pc over wifi while keeping the display switched off?
2. Can it be done using ioctl and ndis drivers?
