Interestingly there is no JVM available by SUN (maybe cause M\$ always have there own meaning about standards in the past)

And exactly what does that mean? ALL of the Java JVMs you list (and just about every one for any mobile device out there) varies a lot in their own implementation, so it appears to me that the Java community itself has no "standards" when it comes to mobile platforms. Write once run anywhere with Java is a pipe dream, as anyone who's tried to do a mobile app that works on multiple devices could attest.

Windows CE is as standard as any other embedded OS, and you get a vast majority of the source for it with the tools, so there is no technical barrier to Sun creating a JVM. Why Sun hasn't done a JVM for Windows CE I'm guessing has a lot more to do with business and money (yes, even your beloved non-MS companies some how have to make money as well – amazingly employees for Sun don't work for free either). The Windows CE market is small, and there's little monetization in generating and supporting a JVM for CE. Sun target s the enterprise market, and they've likey determined that there isn't any business sense in them spending the resources doing the port.
