Hi experts,

I am facing an issue of my label control defaulting to the original text after the Pocket PC Screen Orientation changes.

I have anchored and dock my controls in my form and all my controls is resize correctly after the orientation has changed. But when I change my orientation, my label control text, which is populated during run time, has its text changed to original. E.g in form design, i input the text as "Label". when i run my application and load the form, my application will update the text to "Test". but after i click on the Pocket PC button to rotate the screen, my label text goes back to "Label".

Whats the form event that is called and triggered after each screen orientation changes?

Hope to get replies from you soon.

Thank you :)
