This is making me nuts. I have active sync working with wifi (HP5555) and Linksys wrt54g. But then I cannot connect to the internet or a pop3 account without going back into network card, set up and changing the wifi setting to "Internet". Then can do the above, but to sync then i have to go back and change it to "work". Isn't there a better way?

John

>>

>> *When I try to sync via WiFi, I can see the PPC trying to connect to my desktop and then I get an error message – "VPN Server problems. Verify username and password, then try again". What Username and Password should I be using? The box that I sync with is a WinXP HE box. My administrator account is the only account on the box and that one does not seem to work. I do not have any file sharing enabled on this box, so there are no share names or passwords.*

>>

>> *My network is switched with one leg going to an Access Point – 128bit WEP enabled. I have no problems on the PPC getting to the Internet and/or syncing via USB cable. I am unable to see my PPC (a Toshiba E800) when browsing the network, but am able to ping it by name.*
