I have an iPAQ 5450 (PPC 2002) with the built in iPAQ WLAN Wireless Adapter and am having problems connecting to the internet via a Linksys WRT54G Wireless Broadband router. I have the latest updates for the adapter and router.

With WEP enabled/disabled I get a good signal, no IP address and cannot connect to the internet. I keep getting: "Trouble Connecting; Unable to connect with current settings." Any ideas?
