I'm using Windows Mobile 2003 2nd Ed. (4.21.1088 build 14049) on a Dell Axim X30 at 624MHz. I've managed, somehow, more by luck than any skill, managed to get it to work with my wireless router connected to my DSL line. Internet Explorer works fine except there are a few websites where I need popups to be allowed to use some features. The IE software with this release of Windows Mobile OS automatically blocks popups and I can't for the life of me figure out how to stop it from blocking them. I'm guessing it is something incredibly simple and that I'm probably overthinking the problem and its solution. Does anybody know how to change this?
