No, unfortunately nothing in any of the event logs. I just ran through another series of tests using two different logons and there wasn't even a blip in the logs. I have to think it's finding the share since I'm getting the logon prompt. Also every time I press OK and get bumped back to the logon screen I see a message at the top of the screen that says "Logon failed". So for whatever reason it's just not passing my credentials correctly.

Do the servers Event Viewer logs give any clues as to why the login attempt failed?

Nope, it's WM2003 2nd ed. My domain name never gets truncated, but it's pretty short – "vertechs". Strangely enough I can access other shares like you can – a share on my workstation shows up fine after I enter my credentials. I'm not running SBS like you – I'm running regular server 2003. So this seems to be some kind of issue w/ server shares and WM6? Seems strange...

Oh, and GO HEELS – FINAL 4 AGAIN!!!

"Sven" wrote:

Hmm, I can't get to shares on my SBS2003 either. Don't need this much so hadn't tried before. Can get to about any other share on the network. I notice that the login that asks for domain lets me put in my

Re: Can't use WM6 to access network shares

domain, but
when it throws that screen again the domain is truncated.
Wonder if
someone
messed up the length of that field.

Is your PPC that works a WM6?

Thanks, Sven. Tried this and get the same
error. I actually use Resco
to
map a drive, type in "\\server\share" and fill
in the options to log in
as
a
different user. Then I click "Share" and
immediately get taken to the
same
credentials screen I would see if I tried to
connect to the share using
the
WM6 interface. I type in my password again
and get the same error
screen
about cannot find or no permissions.

This is a little frustrating since it works on
my other PPC. I know
I'm
entering my creds correctly, and I have all
the appropriate
permissions,
but
it's like my login is being rejected for some
reason – I just can't
figure
out where it's failing.

"Sven" wrote:

Pick up a trial of Resco
Explorer and try it using
that. I think you

Re: Can't use WM6 to access network shares

will
find the interface and
capabilities nicer in any
case.

Hey, I just
picked up a
new HTC
PPC6800
phone for
which most
everything
seems
to work
correctly
except
connecting
to shared
folders on
my
Windows
2003
server. I
seem to
have
connectivity
to the server
- I can ping
it,
and
when
I try to open
the share I
get
prompted
for user
credentials.
I type
in
my
credentials
and click

Re: Can't use WM6 to access network shares

OK, then I
get dumped
right back
to the
credentials
screen
repeatedly
until I
cancel the
operation, at
which point
I get
the
error:

Network
resource
cannot be
found or
you do not
have
permission
to
access
the
network.

I've tried 2
different
sets of
creds, both
domain
admins, but
no
luck.
The
thing is, I
can access
the share
fine from
my old HP
PPC using
WM2003,
so
I
feel like the
problem is
on my
phone, not
the network.
I've gone

Re: Can't use WM6 to access network shares

Re: Can't use WM6 to access network shares

through
the
settings on
the phone,
and I guess
they look
correct –
my wireless
card
is
connected
and set to
"Work"; I
can't figure
out what the
problem is.
Any
ideas?

Thanks,
Chris
