I need help setting a wired 10/100 MB Ethernet card on pocket pc 2003. It is a Billionton 10/100 Slim Ethernet Part# CFLA2-100B. The driver in the Cd does not support pocket Pc but it comes with Win CE 3.0 driver. I can see that it has been installed on my pda as it's listed in the remove program list.

It also shown in the wireless Network card, I can see it in the Setting->Wireless Network->Network adapter-> CF10/100 Based Fast Ethernet Driver. Just above the NE2000 Compatible Ethernet driver

I want to connect it to my Netgear DG814 ADSL. I don't have wireless access point and the ad-hoc wireless is too troublesome as it seldom work.

How do I set the cf card IP, submask and gateway for this wired LAN card? There is no software for it; it just comes with the driver. The 2 green light on the card is on, with 10/100 on all the time and the link/Act light is blinking. I tried the "connect terminal" program but it did not work. I look on my netgear router and my pda is not attached to the router.

Out of desperation I even tried to set it up under the Wireless Network adapter setting. Has anyone sucessfully setup a Wired LAN CF card? Please help
