Hi,

The driver (version 1.6r) for the Pocketop Infrared Keyboard also includes a software to rotate the screen. Under PC2002 this worked perfectly! After I updated to WM 2003, the driver is again working, but unfortunately the rotation does not work any more.

When setting rotation, the tool asks me if it should activate the rotation driver and soft-reset the device (as it did under PC2002). If I confirm, it reboots, but when I try to rotate then, it again asks me if it should activate the driver... (which was not the case under 2002)

any ideas, or workarounds?

bye  
Marcus.
