Battery life on the 624, which always runs the CPU at 1.55V, is about half that of the 312, which always runs at 1.25V. The 312 can be clocked at 416 w/o problem (and it still is 1.25V; and the 624 is still 1.55V at 208), but unless an app is CPU bound, it won't make any real difference. Search google for the 624 versus 312 comparison study, if battery life is a concern. I think it was done by/available at aximsite.com.
