Hey I have the 4705 and I got this program the other day its called SKTools. It is the greatest program for twicking and finding memory issues and relocating stuff. It will relocate all the DLL's that can be safely done to wherever you want to put them IE(File Store). And you can install most your APP's there to free up storage space so your Program Memory is maximized. You can get a free try at Handango. It's great it even gives the the equivalent of task manager on XP so you can see whats running in the background sys wise. And see the auto launch stuff so you can turn off things that you don't want to launch to free up resources.
