Try MemMaid. It's got a Storage Usage tab, which can display as a TreeView or as a chart. I was just checking out mine today.

Hi folks,

I'm continually running low on storage memory, and trying to figure out what data is using most of the space. Is there a program similar to the PC's Treesize which will scan the memory of the PDA and show where it's being used? (in terms of files and folders) PDAs never seem to be great at reporting exactly what is using memory. Further confused by the tree structure that Activesync shows.

Also is there a way to move My Documents, other than just copying the files elsewhere? I assume that My Documents is located in PDA's main memory, which seems a slightly daft design idea (unless you have no other storage of course).

TIA
