Good day,

I've scoured this newsgroup and other sources but cannot seem to find a solution to a particular problem I'm having. Essentially, how would one "remote desktop" *to* a Pocket PC running Windows Mobile 5.0?

More details on my particular dilemma: I have a Pocket PC in a hard-to-reach place in another room to which I need to add and modify files. I can use Active Sync, but that would require me to connect the device to a desktop, and it's in a spot where a physical connection to a PC is not an option. The Pocket PC has access to the Internet, so connecting remotely wouldn't be a problem.

Many applications allow a Pocket PC to remote desktop to a server or desktop, but I need the opposite and cannot seem to find a solution. Both freeware or commercial software solutions would be greatly appreciated. Even one with a command-line interface would do the trick, if no GUI solution is available.

Thanks in advance,
Conrad Eaglehill
