Hi Jeffery,

Yep, I'm pretty certain you're right, my Cert name needs to match the address typed into IE, in other words the public ip address, not the local server name. I'll check out dyndns.org and see what I can do there. Thanks for your help...

Jason.

Hi Jason,

Great to hear that you got it all working on port 80! Sorry I'm not too familiar with the way SSL certificates are created and installed, so I can't be much help from here on out.

Sounds to me though that it is a problem that you are connecting to your public IP address and the certificate common name is your local hostname. I might try to use a free dynamic DNS service like dyndns.org to create a public hostname "[yourname].dyndns.org" then create a new self-signed certificate using that address. I don't know if that is actually possible, but it might be worth a shot.
