I recommend following my blog because his q is also answered there, in the Safe Mode Bible (<http://www.pocketpcmag.com/blogs/index.php?blog=3&p=1255&more=1&c=1&tb=1&pb=1>)

In a nutshell: use for example SKTools to clean up the power-on notification queue. It has nothing to do with \Windows\Startup, as has also been pointed out in the Bible above.

Please see the Pocket PC Mag Expert Blog (including mine) at <http://www.pocketpcmag.com/blogs/> – you will definitely like it.

"Stevedalbo" <dalbox@xxxxxxxxxxxxx> wrote in message <news:uVHgto2jHHA.4112@xxxxxxxxxxxxxxxxxxxxxxxxxxxxx>

I have an ASUS A696 pda.
I've installed and then uninstalled Viamichelin navigator but now, every time I switch on the device, an alert (Notification error) appears, saying: "Can't start \Programmi\Viamichelin\navigator\GPSUtility.exe".

Autorun and "Esecuzione automatica" folders contains no links at this application.
Searching all the registry, no GPSUtility string found.
I've tried to edit some db with dbview but this program doesn't find any database.
I have some ideas that the .vol files in the root directory contains some informations on startup programs, but these files are not editable and not readable with common software tools like file explorer or Total commander.
Unfortunately the rom image of this pda is not present on the ASUS site(too recent model?), so I can't restore the O.S. and I must resolve the problem.
Could somebody help me?
Thanks
