Hello,

I'm a newbie to WM6. I've purchased a Samsung i780 in Europe (3G and Wifi).

I would like some explanations to understand how the network management is working vs. the connections.

For the moment it's a mess (both in my Smartphone and in my head):

- I'm using a 3G data package but must go through a proxy to get it unlimited
- I'm using my ISP wifi connection (no proxy)
- I'm using my office connection but no luck VPN client is not compatible with my company VPN server (Cisco)
- I'm using my ActiveSync connection but then it adds my company proxy to my office network which is used at home to connect to my ISP wifi ...

Any help will be appreciated,

Thanks,

Tom
