

Creating a custom field in Project Server

My manager wants to create a new field for a project in order to input an integer associated to a "bug" (for use with a bug-tracking application). Is this field added to one of the MS Project tables in the actual SQL Database? If so, which table? If you don't modify those tables, how would you create this field? Also, once the field is created in the database, how do you modify the project form itself to allow the users to input this new integer value? I'm just trying to get a general scope for whether any of this is even possible before I start with the process of installing and learning MS Project.

Signed,

Know nothing about Project Server! :?)
