Mingo,

I assume the pool file had no problems before the one user with Project 2002 opened and saved it. I don't know if this will help but here are a couple of things to try.

First, have the user with 2002 go to Help/Detect and Repair. After running the repair, open and immediately save the pool file. For that matter, it wouldn't hurt for those users with 2003 to do the same Detect and Repair process.

Second, you mentioned saving as an *.mpd but didn't say if the *.mpd file was opened – only that the file was resaved as an *.mpp. Saving a corrupt file as a database file and then re-opening can sometimes clear corruption that may exist.

Hope this helps.
