Probably no easy way for the desktop version. Does IT not remote access to the machines so that they can check? This is a bit clunky but better than walking around.

This is something that your organisation needs to audit regularly to prevent the use of unlicensed software on its network. You can get admin applications that provide lists of installed applications on various machines and that might be a way forward.

Hi,

I work in a big organisation and my team had purchased some VLK (Volume Licence Keys) for project 2003. the previous person in charge had handed out several copies of the Project cd to ppl at work but did not keep a record of how many ppl have installed the software. We are currently expanding and have new project managers who need project 2003 installed. The problem is i know we had around 26 licences and am sure not all of them are being used, but i do not know how many more licences i can still use or if we have already installed more than we could. I am trying to avoid buying more licences cuaz we are upgrading to 2007 in 3-4 months ...

so the question is .. is there any way to check how many copies have been installed using tht product licence, other than actually goin to every computer and then checking the product key on them ???

any help will be appreciated
