Hello Floyd5,

Sorry, the lookup fields in Project are not multi–select fields. It may be possible through enterprise fields using Project Server, I don't know. If you are using Project server, re–post your question to the Project Server newsgroup (microsoft.public.project.server) If you're not using server, you'll either need to create additional lookup fields for your additional systems or create additional entries in the lookup fields to combine entries.

I hope this helps. Let us know how you get along.

Hi,
I'm hoping someone can help me. Using MS Project 2007, I've created a value list via lookup and want to know how I can allow multiple selection of this list. For example, I have a field called 'systems' and i want to be able to select one or more of the systems in the lookup list. With the lookup function, it will only allow 1 selection. Is using the lookup function correct in this case, or is there another way I can do this?

Thanks in advance
