That option never came up. It just started saving to my computer. Thanks for the links. I'll read them as soon as I get some jewelry ready for the museum. (did you read the site or just check the code?)

The update is loaded, however backarseward is was accomplished. Might check the load times and the links – they are all free of overlaps. They work on my system, the one in my studio, and the one in my bedroom. Same for 2-Lions Glass, but we use IE7 (unless he avoided the auto update and still uses IE6).

Lookng at the site directory, I can see some monster files from the backgrounds. Hmmm. Bruce knows how to rezise those... Aha-help kind of at hand.

I'll keep poking at this for the next few days to see what needs to be done per the links you sent.

Thanks for all your support! I really could not have gotten this done without you.

I was suggesting that when you go to Publish to the Web, and you get to the Save In dialog, that you probably had it set to save to My Computer or Desktop, and that you should change it to My Network Places. If that is not the case you can perhaps troubleshoot your issue by referencing the uploading articles here:

<http://msmvps.com/blogs/dbartosik/archive/category/1921.aspx>

And perhaps read the instructions about how to use FTP or HTTP here:

<http://office.microsoft.com/en-us/publisher/HA011186811033.aspx>

You completely lost me on that one. Change what back?

I tried to load it to the site but got the error msg "cannot connect to the FTP server on the computer named 2-Lions.com". It continues with: "This error message is usually associated with an attempt to access an FTP (File Transfer Protocol) web site through a fire wall/proxy server and the proxy settings are not set correctly to gain access." (I followed the MS link and there are no help files on this error...)

Nothing has changed on this computer, least of all the firewalls; I get no site logon option and the files keep ending up on my computer. I managed to get an update loaded by getting onto the site itself and copying the files to the host. There are some interesting page names now, but at least the edit is up.

This cannot be the proper procedure. The shortcut that is supposed to be on my network places doesn't exist! (per Pub: "when you publish a Web site to a location on the Web or a network, a shortcut to the Web server or network server will appear in My Network Places.")

[NB: I freed the page links, reduced the image sizes on home page and reduced all page banners – now minus the fade I had. Hopfully the links work noaw and it loads faster.]

You just got through directing the html output to your computer to test. When you Publish to the Web, you changed the direction of the output to your computer...change it back.

I have a web site awaiting an update.
According to the Pub help files,
Pub
should have created a link to the site in my
"Network Places"
folder when I
uploaded the file. It didn't. PUB keeps trying
to publish the site to
my
own
computer – it does not even look on line.

I spent almost an hour on the phone with the
site tech support trying
every
possible avenue. Pub isn't a big web site
editor so no one was able to
help –
and he did try everyone in his office!

Does anyone have a fix or workaround for
this? Or a reason for the link
not
being created in the first place? I don't want
this battle every time I
need
to update the site, so a fix is preferable!

The (frazzled) Kat
