brelade,

Sorry about that OT= off topic, or in other words I was going to digress from the subject of the thread.

Vista...nope. I won't bother even testing with it until SP1 comes out after the first of the year, and even then I don't plan on moving to it for production work for as long as I can hold out. In fact, I just bought an extra copy of XP pro in case I don't get around to replacing my laptop before I can't get XP installed by the manufacturer. MSFT just extended that for another year, apparently cuz there are a lot of people like me that don't want to make the change over. Vista is such a resource hog, that it wouldn't even run on three of my machines.

As per the width of the page, I have decided perhaps I need to be more flexible with that. MSFT added a 984 pixel wide default width to the choices in Publisher 2007, along with 760 and 600. Also I just bought a new mouse that has horizontal scrolling built into the wheel, apparently just for people like you ;-). Those things gave me pause. While I still prefer a more narrow page and think that wide pages that require horizontal scrolling to read should be avoided, who am I to buck what seems to be a growing trend. And FWIW (for what its worth ;-)) I do have a 19" monitor...I just don't want to have to view a website full screen. I typically have multiple windows open and each are around 700 pixels wide. This means I can read all the main content without horizontal scrolling of pages that are less than 800 pixels wide....just the way I prefer to work.

As Mike points out, your home page is still very slow to load, but then it is very graphical intensive. I suspect you have, but if not, be sure to run the graphic compression feature on all the images. I didn't say anything this time about the width or the loading time, simply because I wanted to compliment you on the progress you had made...not criticize what still needed to be tweaked.

And I did check the site in FF, IE6 and Opera as I was curious if the new navbar worked ok in those three. I wasn't able to reproduce Mike's issues. You gotta forgive him. He builds his sites using Web Plus which generally

Re: How to; Click on pic to bring up a larger photo and a caption

Re: How to; Click on pic to bring up a larger photo and a caption

have better cross browser support than Publisher sites, and he likes to poke us with a stick about it every once in a while. <grin>

Cheers David.

Still not up on computer language "ha ha", What does OT mean ????????

I have started to look at HTML & CSS, well what i should say is, i have the disc's to learn from just have not plucked up the motivation or brain cells yet to start.

Come on David have you looked at Vista yet, or splashed out on a bigger monitor yet, so i can get away with bigger page sizes.

Hopefully my suggestion will work for Special-EFX.

Always good to hear from you.

Cheers

Brelade,

Hey...this is OT, but I must say that your website is looking better each time I see it...a lot tighter and cleaner these days. The new navigation system is much better than your original across the top. You have come a long ways since you first started this site. Kudos!

Special-EFX.

Don't know if this will help.

Create a folder on your host server called "biography".

THEN!!!!!!!!!!!!!!

Re: How to; Click on pic to bring up a larger photo and a caption

Re: How to; Click on pic to bring up a larger photo and a caption

1. Open a new blank page, Size the page under page setup.
2. Add your pictures and text as required– Once Happy.
3. "Save" as a Single Web Page (Under File Save As) – Read Line 6 1st
4. Give you page a name – Then choose Save as Type – Single File Web Page.
5. Save the above to your Server,
6. I save to my Docs 1st as a normal Publisher file then once happy then re–save as a Single web page again to my Doc's drag the file to my server folder.
6. Add the following code with Insert HTML Code Fragment below any picture to open a new window.

My code:

```
<a target="_blank" href="http://www.breladecockerspaniels.co.uk/images/cocker spaniel dogs/morgan_main.jpg" image</a>
```

You "have to" create an absolute link, you will notice the href= is my server location & the / are the different folders within.

In your case:

```
<a target=" blank" href="http://www.yoursite.co.uk/biography/nameofperson.mht">Enlarge image</a>
```

One difference from my code above is add (. mht) to the end of the link instead of .jpg which as you know is for an image extension. I currently only enlarge images, the part (>Enlarge image) you can change to read what ever you want, this is the only part viewers will see on the page below your images.

Re: How to; Click on pic to bring up a larger photo and a caption

Each time you wish to make changes, go to your original in your Documents make changes then re-save as a single web page then upload individually to your server, just to reiterate, the link will be provide by the above code.

I hope this is of some help, i am definatley behind you in remembering our fallen comrades, I am a serving British Royal Marine Commando and too have lost comrades, good on ya for doing this for your comrades.

David F is more a guru on absolute links "He told me" if you have any problems let me know, but more than likley David will be able to help.

Cheers, post back with your web address, i would very much like to see it!!!!!!

Hi all, you've got your hands full working with me! I am building a memorial website that will have a page with photos and names of fallen EMS workers. I want to have the page setup where the photo can be clicked on, then a larger photo with a biography will appear about that person under the photo. Then some way to get back to the page with the other fallen comrades. I am learning, slowly, and don't know much about the codes, etc. Simple

Re: How to; Click on pic to bring up a larger photo and a caption

plain English works best for me! I appreciate
any help.

Thanks in advance
