Looking for a source of macros to use in Publisher

Since Publisher does not have "Record a Macro" as some of the office products have, I am looking for a source for a particular function. I have a site with several pages that have the same features (navigation bars, text boxes, art work etc). I want each page to be the same as the others so when one goes from page to page the similar items on the page do NOT move around. The method I am using now is to construct the entire site and then on the first page position everything on the page to fit the area and look the best. Then I note those settings and go to each page and set the properties of each item to the numbers that were noted. Now when a one goes from page to page nothing moves. What I want to end up with is a macro to position objects on each page in a pre determined place. Manually doing this is time consuming. I do realize that if I built the first page and positioned everything and then added pages it would do alot of the for me. BUT I have a tendency to redo a lot of positioning after the site is built. The STRAW MAN theory is alive and well here.

A source of developed macros would be appreciated (they don't have to be the exact thing I want, I can modify them to fit). I have been searching the web but no luck yet.

THANKS!

Spike
