Matthew.

I'm no expert on "Word" but in the past I've had occasion to produce something similar to that which you are attempting, so please check with someone more knowledgeable than me.

However, if memory serves me right, I censored to the chosen position on the page and inserted the table there. Because of the way 'tables' work, cells/rows/columns may be 'merged' which makes the dividing lines disappear and contains text within the merge (as if it's a page on its own) By the way, the lines may be either 'virtual' or 'actual' which helps with layout formulation!

The insertion of a 'table' across the normal run of text, lets the text re-commence after the completion of the box. This gives a succession of Text-table-text. In effect, the 'table' displaces the text in the area it occupies.

Enlarging the box vertically 'forces' down the re-commencing line of text.

Sorry if this sounds complicated, but I'm writing this from long term memory which at my age may well be a trifle faulty. *However* I was able - by dint of trial and error - to make it work.

...but as I say, someone with more knowledge than I, will no doubt make the theory clearer.

John
