-

I am having a problem at my school creating custom borders on some PC's but not on others.

We have 18 networked PC's with a file server, where the Publisher clipart resides.

All PC's can insert clipart without problem, whilst others, when trying to create a custom border can get the clipart catalogue up, choose an image, be asked for a name for the border, then be told that the action could not be completed. I know that it is not possible to use any piece of clipart as a border due to the size or colour complexity, but this is not an issue in this case.

I can create a border on one PC, then try and use the same image on another without success.

Any help with this problem gratefully received.

TIA

Mike H
