Surprisingly, the entire collection of Firefox instances closed when I managed to catch the close icon on one. These are the times when I wish my Microsoft Trackball Explorer would work correctly (never has in Vista). I have always had on button set to close the active window. Can't do it now.

BTW, I create all PDFs with Adobe Acrobat 8 Pro. However, I do have PrimoPDF and win2pdf for demonstration purposes. And for my monthly Q&A article in our Computer Club's newsletter.

Hi Charles,

Unlike most PDF conversion tools, in Pub 2007 you File > Publish as PDF or XPS... That opens a dialog where you can choose either format. Note also at the bottom of the dialog that you have a Optimize for option. Click change to choose what type of PDF you want.

XPS is a new "document storage and viewing specification developed by Microsoft. It is aimed to be a complete XML-based..." :

[http://en.wikipedia.org/wiki/XML\\_Paper\\_Specification](http://en.wikipedia.org/wiki/XML_Paper_Specification)

XPS files will be opened by Office 2007 applications.

Originally the PDF conversion was built-in to the Publisher and the rest of Office 2007 Beta, but at the last moment it was pulled and offered as the add-in. Rumor has it, Adobe had something to say about that.

194 instances! Whew...bet that took a while to shut down.

The Office 2007 pdf maker shows up as a printer driver called Microsoft XPS Document Writer. I just created one. When I tried to open it, Firefox(?) suggested a program to open it. Thought I would give it a try. By the time I could get things under control 194 instances of Firefox had opened. I have been unable to find a program that will open it.

DavidF,

Isn't the "built-in" capacity a separate  
download or install feature?

It sounds like the text is  
being converted to an  
image. You can try going to  
Tools > Options > Web tab  
and uncheck send as an  
image (may be somewhere  
else in 2002), and send as a  
html formatted message.

However, that won't  
overcome design problems  
where you have overlapped  
elements, or used non-web  
friendly fonts, etc. and the  
text is still converted to an  
image. Furthermore, if you  
do send in html format,  
some email clients will not  
be able to read your  
message.

To get the most consistent  
results, convert your  
publication to a PDF and  
attach it to the message.  
www.primopdf.com is a  
source for a free PDF  
creator. Pub 2007 has this  
capacity built-in.

When  
receiving  
e-mail from  
publisher  
version  
2002, the  
script is  
fuzzy  
looking.  
I've tried  
different  
font's, but  
no help. I've  
also tried  
them on  
different  
CPU's and  
notebooks  
and they are  
still fuzzy.  
Hope  
someone  
can help.  
Thank you,
