Javascript and java are two different things, and the user does not need to have java installed. Try this snippet:

```
<A HREF="javascript:print(document)">print this page</A>
```

The problem you will have is that it will still just print the page, just as if you used the print function in the browser. If you want a "print friendly" page, then you have to create it as a separate html file, link to it, and when the user goes there, they print from that page.

Post any follow up questions in the web newsgroup:  
microsoft.public.publisher.webdesign and we will try to help you there.

Mellisa,

I am aware of the print function within the browser. However I wanted to add  
a printer icon to a specific page and or text to give the user the  
flexibility of printing specific text(s) (articles).

I think i might be able to come close to this by using the following code:

```
javascript:print()
```

The piece of code requires that java is installed. Therefore, I was  
looking  
for similar code that I will allow printing regardless if the end user has  
java installed or not.

I have created a web page, and in it I would like to add the  
ability  
for

the

visitor to click on a printer icon and print it (perhaps in plain  
text  
and

or

graphics). I've searched within Publisher 2007 and did not  
find  
anything  
related to this. Can someone suggest a solution? Thanks!!

The option is there in the browser itself.
