Sure.

This following line is a SQL query that can be executed in the SQL Enterprise Administrator tool called "Query Analyzer"

```
select user_name0 from system_disc where name0 = 'machine name'
```

The query instructs SQL to "select" the user name associated with a specific machine name from the DB table called system\_disc.

If you open the query analyzer application and select your SMS DB from the drop down box you can copy and paste the line into the query windows and press F5 to run it. You will need to change the text (machine name) from between the apostrophe's to a netbios name applicable to you. Be sure to leave the apostrophe's.

You could also run this:

```
select * from system_disc
```

...which will output all of the data in the system\_disc table. From here you can copy the output and dump it to an excel spreadsheet for sorting etc.
