Hi, I need help

I have recently installed SMS 2003. One central site with advanced security and seven primary child sites with standar security.

The fact is that I have manually installed SMS clients (Workstations) without problems but when I wanna use Client Push Installation to deploy other clients (servers and DC's) and nothing seems to be wrong.

I have reviewed the settings and I don't find anything that could help me to find out what happen.

In Client Push Installation Properties I have enable Client Push to servers and domain controlers, Platform dependent. I have several accounts with local and domain administrative credentials and the sms service account. How can I give the SMS service account local administrative rights on a DC?

When I launch Client Push Installation wizard only checks the machines that have SMS client installed. Please, how can I do to resolve this?

I send part of the ccm.log if it can help
