Thanks Steve but the DCOM permissions were set properly. So far the only way I have been able to get this to work is making the user a local admin of both the SMS server and the server the database is on. However this is a security problem. Still trying though but haven't come up with anything more restrictive that works. Any other ideas?

You probably need to adjust the DCOM permissions on your server, see the last FAQ on this page:

Thank you so much – it makes sense now and I set it up accordingly. I'm on to problem number two now and have tried almost all the suggestions I could find. I loaded the SMS Admin Console on the computer these techs will be using. They do not have domain admin privileges but they do have local admin privileges. They are unable to connect to the site. I connect fine as Domain Admin on the same machine. I tried making them a member of DCOM Users and even SMS Admins to test but no luck. I do not want them to be a local admin on the SMS server. Our database resides on a separate server. I'm sure it's a rights problem but I'm not sure where or how to fix it and not compromise the security of the servers. Any ideas?

Thank you for your help.

Dawn,

SMS security is a bit different from normal Windows security.

Re: New to SMS – have a Collections question.

under Site Database. If so how do you do this. I have been reading the manual and am confused. I think because I was not part of the install from the beginning. Any help is appreciated.
