I am constantly faced with my MP shutting down on my secondary. I normally fix it by just stopping both IIS and sms services including the sms agent host service. Sometime i have to kill the ccmexec.exe process first for the agent host service to stop. Once done i start up iis, and the sms services and then do the normal checking of the MP with mplist and mpcert. It would work fine for a week then eventually die again.

Has any one had this same issue?

I am currently on sms 2003 with sp1  
HPscantool installed  
microsoft windows update scantool installed

any suggestiong. please free to email directly as well.

.
