Hi,

that's new to me. Where can you configure that? The options available are:
local domain, local forest and custom ldap or gc query.

Yups, in the configuration of ad system discovery you can specify a site to query.

Hi,

I have defined an AD Site Name in SMS Site Boundaries. I need the AD System Discovery to retrieve only the computers within the subnets assigned to this AD Site.

Is this possible using AD system discovery?

Thank you.

Randall.
