Hi, I had an issue on my SQL 2005 server which is local to the SMS primary site server. I had to restore the Master database from a SQL backup, ever since the restore my Secondary Site management points cannot connect.

It is not IIS related and the secondary computer accounts are in the SMS_SiteSystemToSQLConnection_site, I am pretty sure it is SQL security related.

The site is in advanced security mode but the SQL server is now in Mixed authentication mode.

I think what has happened is when I have restored the Master database the security has got mixed up. Also the problem seems to be that rather than the computer account being used to access the database, it is trying to use NT AUTHORITY\ANONYMOUS LOGON. I can get this working by granting NT AUTHORITY\ANONYMOUS LOGON sysadmin on the server but this is obviously a security risk.

The SQL logs showed

```
Login failed for user 'NT AUTHORITY\ANONYMOUS LOGON'. [CLIENT:
ipaddress]
Error: 18456, Severity: 14, State: 16.
```

But as sysadmin I get

```
Login succeeded for user 'NT AUTHORITY\ANONYMOUS LOGON'. Connection:
trusted. [CLIENT: ipaddress]
```

However this should be authenticating as the secondary site computer account.

Anyone any ideas?

.
