Hi Ryan,

I'm not sure that the capinst.exe will run properly via a UNC path; however, you can easily amend your batch file to map a network drive (temporarily) to call capinst.exe as follows:

```
net use t: /delete
net use t: \\sms_server\SMSCClient
```

```
t:\i386\capinst.exe /AdvCli /SLP=laxsms /advclcmd smssitecode=auto
ccmenablelogging=true ccmlogmaxsize=1000000 ccmloglevel=0
```

```
net use t: /delete
```

You may want to do some verification beforehand, so that you only install the SMS client if it is not already on your boxes.

Also, as far as the client pointing to the wrong server, you should use SMS Trace and look at the following log on the client in the %WINDIR%\System32\CCM\Log folder:

LocationServices.log (Verify what the client is "discovering" for its Management Point

If the server the client discovers is not what you expect, then depending on your Enterprise architecture (i.e. Active Directory or WINS), you may need to make some follow-on to either Active Directory or WINS. Since I'm not quite sure of your configuration, your site boundaries could be an issue but I doubt it based on your original question.

Hope it helps!  
Scot

Thanks, that worked! Now I have a different issue. Trying to install the SP3 client on a Vista workstation. First I ran the ccmclean utility and removed the advanced client on the Vista machine, and now I am trying to install the SP3 client through a logon batch file. My command looks like this:

```
\\hhsdc\netlogon\capinst.exe /advcli /slp=laxsms /advcli cmd smssitecode=auto  
ccmenablelogging=true ccmlogmaxsize=1000000 ccmloglevel=0
```

But everytime I run this, nothing happens. I'm watching the processes on task manager, and capinst runs for a half second but then disappears and the client does not get installed. Any ideas? When I do the push install from the server, the client still points to the old SMS server.

That's not what I meant.

On the advanced tab on the properties you set at the top of this dialog there is an applies onto listbox. Make sure this list This object AND all child objects

Ryan wrote:

Kim – "Allow inheritable permissions from the parent to propagate to this object and all child objects." is checked under the advanced tab. I removed it and re-checked it just to make sure the permissions propagated down.

I just installed SMS 2003 SP3 on a new box (SMS 2003 SP1 is currently running live in the environment on another box). On the new SP3 server, I am receiving an error in the HIERARCHY\_MANAGER component. It states:  
"Systems Management Server cannot update the already existing object "SMS-Site=LSE" in Active Directory". ID: 4912

Re: 4912: Cannot update the already existing object. Need some he

I was receiving a message stating it couldn't even write to the SMS container in AD so I gave the SMS Server account full access to the System container and the System Management container in A.D. After I did that, it then wrote one file within the System Management container (SMS-Site-LSE), but it did not create any subfolders like the previous site has in this location (SLP and MP folders).

So it has full access to the folders (at least I believe it does), but now it seems to be trying to update the file and doesn't have access to do that. Any ideas what I can try? Thanks, Ryan.

Have you given full access to this object AND all child objects? You need to hit the advanced button on the security tab to be able to do this.
