Garth, Kim

Created a bat called NightlyRebootTaskDel.bat

In it I have:

```
Start C:\WINNT\System32\cmd.exe
AT /delete /yes
Exit
```

When I double click it...it runs and gets rid of the scheduled tasks, however command prompt remains open.

"Garth" wrote:

There is no need for an MSI, you can create a package/program with the commandline only, but if you like you can put it into a batch file.

Kim I have another question. Instead of building this into a package.

Could I build either a logon script or a .bat file that SMS could call that would run the

AT /delete /yes from a cmd prompt.

With a .bat my hope would be to run it against a collection and still not have to install anything on a workstation whereas with a MSI you still are technically going to install something that has to be removed

Re: Deleting Scheduled Tasks across the Enterprise using SMS 2003

from ARP.

Hello,

I have a question. A while back before I was here, there was an MSI created. This MSI was distributed via Active Directory and GPO. The purpose of the MSI was to force nightly reboots of workstations. The only thing that was built into the MSI was a custom action:

```
AT.exe 23:59 /interactive  
/every:M,T,W,TH,F,S,SU  
cmd.exe /c  
c:\winnt\tools\shutdown.exe  
/R /t:3600
```

This created a scheduled task on every workstation to reboot them at night. We no longer
