I've found environment variables in HKLM\SYSTEM\CurrentControlSet\Control\Session Manager\Environment. I'll try setting it there.

I'm simply doing an execute program script item on just the patch executable, not calling c/wscript. I'm using SMS Installer scripting to determine if it is a workstation or server so I can automatically reboot workstations, but make the server reboot an option for an administrator who comes along after the thing runs. I also make sure to launch the patch with "silent" options. And some patches come in different flavors for different OSs, so I use the scripting to determine which patch to launch. I know I could do all of this in any number of different scripting languages, but SMS Installer scripting is the one I'm using right now.

Thanks for the hint, I'll be giving it a try today.
