Hello everybody,

I installed System Center Configuration Manager 2007. The site server is running on a Windows 2003 server, which also is a Domain Controller. I want to install the Client software to other computers. I started with one which is in the same Windows domain. I can see it in AD Users and Computers, but I cannot see that computer under Computer Management – Collections – All Desktop and Servers (or any other group under Collections) of Configuration Manager Console. There are as the documentation states 5 prerequisites to install Client software with Client Push Installation method (<http://technet.microsoft.com/en-us/library/bb680537.aspx>). It seems that the discovery part is not working in my case. Any ideas?

Thanks in advance.

J. Leon

Have you configured a discovery method to run?
