I believe that I have the site boundaries configured properly. Site Boundaries include the Subnet IP that our whole department is in and I have also included the AD site for good measure. The Roaming Boundaries include the AD site only. All machines are in the same subnet and AD Site.

The Client Push Installation Account is a member of the a security group which is defined as a member of the local admins group on each machine. Although I am configured for Advanced Security, I have also set the Advanced Client Network Access Account, just to be safe.

All clients are discovered, assigned and have successfully installed the Advanced Client.

I don't see any glaring problems in the ccm and ddm logs except that the server is unable to install a client on one of the machines and that is
