Opened Default Domain Controller Security Policy tab under Administrative Tools.

Log On as a Service is marked as "Not Defined"

AD Users & Computers – Domain COnrollers tab indicates that I am using Default Domain Controllers Group Policy.

Also Note: Both Northglenn and Southglenn have the same policy settings. Northglenn installed, Southflenn did not! What would cause one domain controller to install the client but prohibit the other.

Both machines are on the same subnet, same domain.

Another question: During the installation, the account SMS#_Southglenn is created. The CCMBoot service is created, errors out, but then the account and the service are both deleted. Is there any way to prevent the deletion so that the permissions issue could be troubleshot?
