Giving full control to the System container allows the site server's computer account (advanced security) the ability to create the needed System Management container. The easiest thing to do at this point I would try (in this order):

1. Ensure that the SMS 2003 SP2 schema extensions have been applied (not still at SP1 extensions or something).
2. Assuming you are in advanced security at this point—ensure that the computer account for the primary site server has Full Control to the System Management container and all of its child objects (note that there is no 's' on the end of System for this). If I have assumed incorrectly and you are in standard security, then check that the service account has these permissions.
3. If all of the above are correct, delete the existing information published to the System Management container and allow the site to republish the site information.

Hope this helps,

Hello,

I am new to SMS and have setup a windows 2003 server, with SQL 2005 server,
and SMS 2003 SP2.

Re: SMS Site Component Manager

I have an error that keeps coming up as follows in the System status section. Is it the site component manager. The error I see is as follows

Systems Management Server cannot update the already existing object "cn=SMS-SLP-MTL-MTL-SMS" in Active Directory.

Possible cause: This site's SMS Service account or the site server's machine account may not have full control rights for the "System Management" container in Active Directory

Solution: Give the site's SMS Service account full control rights to the "System Management" container, and all child objects in Active Directory.

Possible cause: The Active Directory object "cn=SMS-SLP-MTL-MTL-SMS" has been moved to a location outside of the "System Management" container, or has been lost.

Solution: Delete the object from its current location, and let SMS create a new object.

Possible cause: The Active Directory schema has not been extended with the correct SMS Active Directory classes and attributes.

Solution: Turn off Active Directory publishing for each site in the forest, until the schema can be extended. The schema can be extended with the tool "extadsch.exe" from the SMS CD.

I am new to this and a little confused as to where and look. I have looked at the local account that it might use which is "SMSServer_MTL". I have added admin rights to this account. Still I get this error.

Any help in the right direction would be appreciated.

This are all trial versions as well.

Thank you

I had the same error. Look for KB830022. In my case the error was resolved by giving the SMS machine name full access to the system folder and child objects in AD.
