Hi,

After several long years now I have the opportunity to do the project on SMS and I am really looking forward and eager to do it. I have not had the time yet to go through the document which I am going through, but would like to ask few questions before I proceed.

1. Can I have a single partition (146.8 GB x 3 HDD) RAID 5 capacity of 280GB? Preferably with the database stored on the SAN? or
2. Can I have two partitions (System and Data) on the server and store the database on the server? If so, will the above disk space be sufficient based on 1000 desktops with a growth of another 200 desktops the next 5 years?

thanks in advance

.
