On the Central site server, I have a entry for the child site The role for this child site is "SMS Compoanant Server", when I try to double click on it, it syas that "Systems Management Server has lost a connection to the Site server".

The same the other way, on the child, there is a entry for the central site server, central site server also listed as a "SMS Compoanant Server".

How do I remove it?

Is it to do with the senders, under central, there is a sender for itself AND the child server, also the other way around.

Thanks

"Sherry Kissinger [MVP-SMS]" wrote:

This is just a guess. Check Site Hierarchy, Central, Site Settings, Site Systems. You should NOT have an entry for the child

Check Site Hierarchy, Child site(s), Site Settings, Site Systems. You should NOT have an entry for the Central.

At least one of your errors looks like one of your sites is trying to install SMS Components on a server which is already defined elsewhere in your hierarchy.

Hi All,

I have a central and primary site server, for some odd reason, it is generating errors and I don t know what to do anymore. The primary site

## RE: Weird Errors on Primary Site server and Central Site Server

server is called PSS and central site server is called CSS. On the primary site server, it is generating the following 2 errors every 2 hours on the SMS\_SITE\_COMPONENT\_MANGER:

### ERROR1:

SMS Site Component Manager failed to configure site system "\\centralsiteserver" to receive SMS server components.

Solution: Review the previous status messages to determine the exact reason for the failure. SMS Site Component Manager cannot install any SMS server components on this site system until the site system is configured successfully. SMS Site Component Manager will automatically retry this operation in 60 minutes. To force SMS Site Component Manager to immediately retry this operation, stop and restart SMS Site Component Manager using the SMS Service Manager.

### ERROR2:

SMS Site Component Manager detected that site system "\\centralsiteserver" is currently in use by SMS site CSS.

Possible cause: You accidentally configured SMS to use this site system as part of this site and as part of site CSS.

Solution: Remove this site system from the list of site systems for this site or for site CSS. The list appears in the Site Systems node of the SMS Administrator console.

What I find very strange, if I go to the primary site server's Site systems, the primary site server is listed, but only shows the role of the central site server as SMS Component Server, if I double click on the central site server, it tells me that Systems Management Server has lost a connection to the site server. This happens the other way around as well, on the central site server, it shows the primary site server (PSS) as a SMS component server, but get the same error when I try to open the properties of the primary site server.

Data flows fine from the primary to the central.

On the actual central site server, I get the following errors on SMS\_SERVER\_LOCATOR\_POINT:

### ERROR1:

SMS Site Component Manager successfully used the SMS\_SERVER\_BOOTSTRAP\_CENTRALSITESERVER service to run the following program on site system "\\centralsiteserver":

```
D:\SMS\bin\i386\slpsetup.exe /install /siteserver:centralsiteserver
```

RE: Weird Errors on Primary Site server and Central Site Server

The program failed for the following reason:

Child process "D:\SMS\bin\i386\slpsetup.exe /install /siteserver:centralsiteserver /s" took too long to execute, and the process (PID = 4320) was orphaned.

Possible cause: SMS Site Component Manager does not have sufficient access

rights to administer the site system.

Solution: Verify that the Site System Connection accounts are properly configured to allow SMS to administer the site system.

SMS Site Component Manager cannot install component SMS\_SERVER\_LOCATOR\_POINT

until the program runs successfully. If this problem persists and you cannot fix it, refer to your SMS documentation or the Microsoft Knowledge Base for further troubleshooting information.

ERROR2:

SMS Site Component Manager failed to reinstall this component on this site system.

Solution: Review the previous status messages to determine the exact reason for the failure. SMS Site Component Manager will automatically retry the reinstallation in 60 minutes. To force SMS Site Component Manager to immediately retry the reinstallation, stop and restart SMS Site Component Manager using the SMS Service Manager.

Can anyone please help me?

Thanks a million
