In your e-mail, it's not clear what the problem happens to be. And it may be helpful to post your concerns on the SMS newsgroup to notify the best experts in the field. For general MBSA issues, we usually request a bit of information to help us troubleshoot the issue. If you could reply with details below, it may help us investigate the issue you are having:

The following information is helpful to accurately determine if there is an MBSA problem.

If MBSA reports a "Patch NOT Found" warning (indicated by a red 'X' in the GUI interface), this means a patch for a security vulnerability needs to be installed immediately to protect your system. Or, if MBSA reports a 'greater than expected', 'invalid checksum' or "required registry key" warning, we will need additional information to identify the issue. Please reply with the following four files captured in a ZIP file:

Run MBSACL /HF /V /TRACE > OUTPUT.TXT (on the local machine – or add the /H <Hostname> parameter for a remote scan) – and capture the HF.LOG and OUTPUT.TXT file

Also run MBSACL /HF /V -History 1 /TRACE > HISOUTPUT.TXT – and capture the new HF.LOG file and HISOUTPUT.TXT file

Please also include

- a.. The exact error message being reported (a screen shot and/or the exact text if possible)
- b.. The version of MBSA being used (from 'About MBSA' or command-line output)
- c.. The version of the MSSECURE.XML file (open the MSSECURE.XML file in NOTEPAD and check the 'DataVersion="xx.xx.xx.xx' information)
- d.. Provide the OS, OS service pack and OS language of the target machine
- e.. Indicate which type of scan is being performed (MBSA GUI scan, MBSACL or MBSACL /HF scan) – and what command-line parameters are being used (if you are using MBSACL)

This will help us quickly identify the root of the problem. Thank you!
