Even with correct indexes, having lots of joins is a known performance bottleneck. How many is "lots"? I guess it depends on the data. The only workaround I'm aware of is to denormalize your data.

Hi,

I am very disappointed with the sql queries performance in sql ce. In my some queries i have inner joins on 9 tables some tables have more then 150000 records. Db size is around 15 MB. If i run that query with particular where clause (ex RoomNo. = 100) then it gives result in 1 minute otherwise i wait for 15 min. & i did not get results. However i am using proper indexing on SARG still response time is not acceptable. I also tried by putting db on sd card doesn't work.

Can any body help me to find out where i am wrong or the limitations of sql ce queries.
